App Development Experience

This was my first time programming in Swift and developing an iOS application. Although it was not easy to learn, I found the experience to be interesting and exciting. Some coding syntax was confusing at first since it was my first time using this programming language. However, a lot of coding rules were similar to other programming languages I have used, especially the basic ones, so they were not so hard to learn.

The biggest challenge I faced was using a Mac since I had never used any Apple product in my life. The other challenge was some coding syntax for Swift programming. Additionally, working with Xcode was a bit confusing at first.

To complete the EU members app, I used various resources, including Stack Overflow, developer.apple.com, Hacking with Swift, ChatGPT, and Hotpot.ai. Hotpot.ai was used to check SF symbols that I could use, but I ended up using just normal images from the internet.

Developing an iOS app using Swift programming was a new and interesting experience. Although there were challenges, such as using a Mac and getting used to the coding syntax, there were also easier aspects. Overall, it was a worthwhile experience that expanded my skill set in app development.

I also have to mention that I'm quite satisfied. The teacher always tried his best to help and I appreciate this a lot. Thank for the course and experience.
